Declaration of the Parties.

The Montreal Protocol on Substances That Deplete the Ozone Layer, which entered into force in 1989, has been key to the reduction of harmful chemicals that are depleting the ozone layer. It has been called “the most successful environmental treaty of all time.” The Montreal Protocol includes the 1987 Montreal Protocol, the 1990 Kyoto Protocol, the 1992Gore-Owen Amendment, the 1995 Montreal Protocol, the 1997 Montreal Protocol, the 1998 Montreal Protocol, the 2000 Montreal Protocol, and the 2007 Montreal Protocol.

The Montreal Protocol is a comprehensive global effort to protect the ozone layer. It is a legally binding treaty that has been ratified by 197 countries. The treaty requires that developed countries phase out the production and consumption of ozone-depleting substances, such as chlorofluorocarbons (CFCs), sulfur hexafluoride (SF6), and hydrochlorofluorocarbons (HCFCs).

The Montreal Protocol is a success story because it has been able to achieve significant reductions in ozone-depleting substances. As of 2020, there is a global phase-out of CFCs, HCFCs, and most HFCs. However, some countries are still using certain ozone-depleting substances, such as PFCs and HFCs, which are used in a variety of applications.

The Montreal Protocol has been successful because of the international cooperation that has been established between countries. The treaty has been able to achieve significant reductions in ozone-depleting substances through the development of alternative technologies and the establishment of a Multilateral Fund to help developing countries phase out the production and consumption of ozone-depleting substances.

The Montreal Protocol has also been successful because of the strong political will that has been demonstrated by governments around the world. The treaty has been able to achieve significant reductions in ozone-depleting substances because of the strong political will that has been demonstrated by governments around the world.
